Abstract

Background: The COVID-19 outbreak which started in China became a pandemic and Rivers State recorded its first case in March 2020. This research assessed the provision and utilization of COVID-19-related services in Rivers State during the pandemic.

Method: This study was done in two phases. The first with interviewer-administered questionnaires to assess the community participants' utilization and opinion about the adequacy of COVID-19-related services provided and the second was the collection of data on the provision and adequacy of those services from the healthcare workers who worked at the COVID-19 treatment centers. Analysis was done using IBM Statistical Product and Service Solutions (SPSS) version 25. Statistical significance was set at p<0.05.

Result: The COVID-19-related services were provided by many stakeholders such as the Federal Government in collaboration with the state government and agencies like the Red Cross. Over 80 percent of community participants were aware of the services provided and 32.8% utilized them; though various reasons were given as challenges for non-utilization such as the fear of leaving the house (63%) and contracting the infection from the health centers (68.7%), lack of facemasks (42.7%), because family members forbade it (41%). The health workers' challenges were increased workload (85.7%), not getting the PPE in their right sizes (55.4%), discomfort with the use of PPE (62.5%), little/no incentives (75%), fear of being infected (78.6%) and fear of infecting loved ones (82,1%). At least 6 out of 10 healthcare workers and 7 out of 10 community participants reported that most of the government-provided services, were adequate.

Conclusion: 3 out of 10 persons utilized the COVID-19-related services provided in Rivers State and most of them were deemed adequate by both community members and COVID-19 center health workers.

Keywords: COVID-19-related services, demographics, presenting symptoms, provision, utilization, Rivers State.

Introduction

The 2019-nCoV or Covid-19 or SARS-CoV-2 spread over the whole continent causing devastating health, economic, and societal effects and was declared a global emergency on the 20th of January, 2020, by World Health Organization (WHO).¹⁻³ Its potential to cause a pandemic worldwide was recognized on February 24, 2020, and was declared a global pandemic on March 11, 2020.⁴ By April 15, 2020, the reported COVID-19 cases worldwide had passed two million, and this was just two weeks after one million infections were recorded.¹

Despite the rapid transmission of COVID-19 infection worldwide, African countries witnessed a low mortality rate. 4.6 The first confirmed death from COVID-19 was reported in Egypt on February 14, 2020, and Nigeria reported her first COVID-19 case on February 27, 2020, when an Italian national tested positive for the virus in Lagos, Nigeria. 7-9 River State recorded its first case on May 25, 2020. 10, 11 There were 8,061,550 confirmed cases and 440,290 deaths from COVID-19 in over 200 republics and regions as of 18th of June 2020. 3

Over the last months, statements on infection control, screening, and diagnosis in the general population have been mentioned. 12-17 The use of facemasks, hand hygiene using soap and water or hand sanitizers, maintaining at least 2m physical distance, coughing into the elbow, and avoidance of touching the ear, nose, and mouth are some of the non-pharmaceutical measures for COVID-19. 18-21 In addition to this, the use of medical gowns and coveralls was recommended for health workers during the pandemic. 21,22

Furthermore, the Rivers State Government instituted services such as COVID-19 testing, contact tracing, COVID-19 information and advice, hotlines/websites, testing/laboratory centers, contact tracing, isolation/quarantine centers, and recently vaccination centers to control the spread of the COVID-19 infection. The question is if these provided services were utilized or adequate. Also, the government provide necessary personal preventive equipment (PPE) and were they adequate or not.

As the pandemic spread to other countries, the infection increased in the younger individuals who are very active and thus this impacted the community transmission and infection of more vulnerable population groups.²³ A study done in the United Kingdom reported an increase in excess hospital admissions since Aug 1, 2020, among women aged 20–40 years old.²³ This is possible because many young people live with their parents and grandparents who are of an older generation and who may have comorbidities and as such, invariably increase

the possibility of passing on the infection to those likely to have severe disease.

This study assessed the community's utilization and the healthcare workers' provision of COVID-19-related services provided by the Rivers State Government as well as their opinion on their adequacy. This study is justified because assessing the services provided by the government by the providers (health workers) and residents of the state will help provide feedback to the government as regards areas that need improvement, and this will help them prepare adequately for future pandemics.

Method

The study was a descriptive cross-sectional study done in two phases among the residents of Ozuoba community in the Ozuoba-Ogbogoro ward of the Obio/Akpor Local Government Area in the Greater Port Harcourt, Rivers State and COVID-19 healthcare workers who provided care at the COVID-19 treatment centers in Rivers State. At each stage of the community quantitative study, participants were recruited using a multi-stage stratified sampling procedure. recruitment process consisted of seven steps. To choose the LGA for the study, a random table was used for the initial random sampling, from which Obio-Akpor was chosen. After that the ward (Ozuoba-Ogbogoro) the community (Ozuoba) were chosen at random. Similarly, random sampling was used at the community level to select the streets, houses, families, and ultimately the study participants. This was done between August and 2022. Interviewer-administered September questionnaires were used to assess the utilization of the COVID-19-related services provided government and the opinion of the community participants as regards adequacy. Self-administered questionnaires were used through Google form to assess the provision of service and perception of COVID-19related services of the healthcare workers between February and August 2023.

Inclusion criteria for the community were residents of Ozuoba a community in Ozuoba-Ogbogoro ward in Obio/Akpor LGA in Rivers State, who were at least eighteen years old, and healthcare workers who worked in the COVID-19 centers in the state who were willing to participate in the study.

Exclusion criteria included individuals who declined to participate in the study at both the community and COVID-19 treatment centers.

Medical personnel who worked at the Rivers State COVID-19 isolation centers including Eleme and Rivers State University Teaching Hospital, Port Harcourt (RSUTH), and other centers filled out the questionnaires

on the provision and utilization of COVID-19 related services through Google form between February and August 2023. Both questionnaires were pre-tested at the Choba community and UPTH COVID-19 treatment center.

Sample Size Determination

Cochran's formula for calculating a sample for proportions, $n = (Z\alpha)2$ pq/e2 n = (1.96), was used to estimate the sample size.

The 95% confidence interval, denoted by $Z\alpha$, is 1.96 when p = 34.0% of preventative actions in an urban population, and q = 1-p were substituted.²⁴

 $379.3 \sim 380$ individuals made up the minimum sample size (n): 344.8 + 10% non-response = 344.8 + 34.48.

Sampling Technique

At each stage of the community quantitative study, participants were recruited using a multi-stage stratified sampling procedure. The recruitment process consisted of seven steps. To choose the LGA for the study, a random table was used for the initial random sampling, from which Obio-Akpor was chosen. After that, the community (Ozuoba) and the ward (Ozuoba-Ogbogoro) were chosen at random. Similarly, random sampling was used at the community level to select the homes, families, streets, and ultimately the study participants.

All the healthcare workers (56) who were willing to participate in the study were recruited.

To be able to assess the healthcare workers' views and those of the community on the adequacy of the services provided amid the COVID-19 outbreak, the excel spread sheet for the data collected for the community was used as a sample frame for a systematic sampling of fifty-six (56) participants that were used to compare proportionately with the healthcare workers data from the community.

The community sample size was 400, while the healthcare workers who participated from the COVID-19 treatment centers were fifty-six (56)

To get a sample size from the community that match that of the healthcare workers a proportionate to size has to be done using systematic sampling technique.

The sampling interval k = 400/56 = 7.14This is approximately 7.

The first participant was picked using a table of random numbers, after which every 7th participant was added. Service utilization was assessed with yes or no questions in which participants who chose 'yes' were deemed to have utilized those services and those who chose 'no' to not have utilized them.

Data was analyzed using the Statistical Product and Service Solutions (SPSS) version 25 (IBM, Armonk, New York, USA). Descriptive statistics were reported as frequencies, percentages, means, and standard deviations. The association between participants' perception of provision and utilization of COVID-19-related services was analyzed using the chi-square test to determine the differences among the groups and significance was set at p<0.05.

Ethical approval was sought from the Ethics Committees of the University of Port Harcourt and Rivers State Ministry of Health Board, Port Harcourt. Respondents' consent was sought after explaining the study to them.

Table 2 shows the community participants' awareness of services provided by the Rivers State Government for COVID-19 control. Over 80% of participants were

aware that the government provided travel advice and information, hotlines, contact tracing, Laboratory testing as well as isolation, quarantine, treatment, and vaccination centers. Most also believed that the services provided were adequate for the COVID-19 pandemic.

Only 32.8% of the participants utilized the services provided by the Government for COVID-19 control. Various reasons were given as challenges for utilization of services. Two-third did not access because of fear of leaving the house and contracting the infection from the health centers. Two-fifth lacked protective wears and two-fifth because their family members forbade them.

Though, 9 out of 10 health workers in all RSUTH and other treatment centers reported that the government provided hand gloves, facemasks, sanitizers, and liquid soap; about a third in all centers reported the supply was inadequate. The provision of face shields was very low and highly inadequate. Statistical analysis showed this to be significant. Table 5.

It was significant that the government provided COVID-19 information/ Travel advice and isolation centers and most health workers agreed the information and travel advice was adequate. Table 6.

Almost all participants in all centers agreed that the government provided training on COVID-19 symptoms, clinical/laboratory diagnosis, and management. Statistical analysis showed these to be significant. Though two-fifths agreed that psychological support was provided for those infected and their relatives, one-third and one-fifth reported that psychological support for those infected and for relatives of those infected was inadequate. Table 7.

As regards challenges faced by health workers at the COVID-19 treatment centers, 9 out of 10 workers agreed that their workload increased, half (55.3%) complained about not getting the PPE in their right sizes, three-fifths reported discomfort with the use of PPE, 75% mentioned little/no incentives, 7 out of 10 feared being infected and 8 out of 10 feared they would infect their loved ones. Table 8.

Discussion

Though the preparedness for handling COVID-19 in health centers all over Nigeria was not adequate, that was not the case in the COVID-19 centers that were set up. There was good representation and adequate healthcare workers in the centers as well as adequate provision of personal protective equipment though face shields were not adequately provided. However, this should not be the case. The leaders at the three tiers of the government need to earmark resources for medical emergencies in all the health centers and Teaching Hospitals in Nigeria and not wait to use fire brigade approach when such occurred. Luckily, this time, the mortality was low, what happens when the next pandemic occurs, and the infection affects many people and is more contagious.

Furthermore, if the already existing health centers and hospitals had been well equipped to handle pandemics, there would not have been the need to put up new COVID-19 holding and treatment centers as those already prepared beforehand would have been used and the resources conserved and used in other area of national development.

The Federal government in collaboration with the state government, the Red Cross and stakeholders form the private sectors who provided finances. All in all, 3 COVID-19 hotlines, 2 COVID-19 holding centers (RSUTH and Mini), 3 COVID-19 treatment centers (Bonny, UPTH and Eleme), 7 PCR laboratories (UPTH, RSUTH, Everught, Shell, Indorama, Nigeria Liquified Natural Gas (NKNG), numerous PPEs and vaccination centers were

provided in the state for the control of COVID-19 pandemic.

Over two-thirds of healthcare workers agreed that the COVID-19-related services (COVID-19 information and advice, hotlines/websites, testing/laboratory centers, contact tracing, isolation/quarantine centers, and vaccination centers) provided by the River State Government were adequate as against at least 8 out of 10 community participants who felt so.

In this study, one-third of the participants used the services provided by the government.

The pandemic brought a lot of challenges to people all over the world. Two-thirds of the community participants in this study reported that they were afraid of leaving home and going to the health centers to access care in case they got infected. Half reported that they couldn't access health care because the pandemic interrupted health services. Other studies done in Nigeria and Africa also reported disruption of healthcare services during the pandemic.²⁵⁻³⁰ Thus, routine medical care was interrupted, and individuals lost their lives because of this. The implication of this is that if the health sector is not properly prepared to have centers designated to handle contagious diseases which could result in pandemics in the teaching hospitals as well as designated health centers in the country, there would continue to be disruptions in health care during those periods. The maternal and childcare, dental care, medical care as well as surgical care were all interrupted during the COVID-19 pandemic.²⁵⁻³⁰

Healthcare workers also faced challenges during the pandemic. At least half of the healthcare workers in this study reported challenges in getting the right size of PPE, PPE discomfort, increased workload, little incentives, and fear of infecting self and family members. A study done in Bangladesh reported that their participants mentioned, a shortage of quality PPE, and a lack of incentives as part of the challenges they faced during the pandemic.³¹ A qualitative systematic study reported healthcare workers reporting insufficient equipment and information, and work burnout as their challenges during the pandemic.³²

Strengths and Limitations of the study

This study listed the COVID-19-related services provided by the government in curbing the pandemic and reported their utilization as well as highlighted the opinion of the participants as regards its adequacy.

The study did not access how the provision and utilization of services were operationalized.

Implications of this study

Seeing how the existing health facilities could not handle the pandemic and the government had to set up emergency facilities to curtail the spread of it, the government should supply the health centers and teaching hospitals with necessary equipment and materials as well as equip and designate emergency centers that will handle future pandemics.

There were challenges in providing services during the pandemic, the Rivers State government is urged to put in place an incident action plan that will be rolled out immediately if there is any medical emergency and also set apart funds for medical emergencies to make the initial rollout easy. Lastly, the Federal government should put policies in place to make the health sector viable and ready to handle future pandemics. They should also increase the budgetary allocations for health.

Conclusion

There was good representation and adequate healthcare workers in the COVID-19 centers as well as adequate provision of personal protective equipment, though face shields were not adequately provided. Over two-thirds of healthcare workers agreed that the COVID-19-related services were provided by the River State Government as against at least 8 out of 10 community participants who felt so.
